Description

JOLLY-MEC CAMINETTI is a leader manufacturer of high-efficiency stoves, boilers and fireplaces since 1968. Our products heat the entire dwelling with air or wet technology and produces domestic hot water for all the family, operating only with totally renewable and ecological fuels: firewood and pellets. The water heating fireplaces, stoves or boiler allow to heat the entire dwelling, even on more than one floor (up to 330 m2), and generate domestic hot water for all the family. They can be integrated in an existing heating system, with radiators or at low temperature and connected in parallel also with other sources of heat such as storage heaters, solar panels and other boilers for energy efficiency. The air heating fireplaces and stoves allow the entire dwelling to be heated thanks to ducting system which does not require masonry work. The air heating system has the advantage of being able to quickly heat the rooms in which the air is ducted. The air products can also integrate a boiler plumbing system, contributing to the heating and reducing the costs of the gas and for the best energy efficiency.

Organization Type

SMEs

Organization Size
